

Invasive Lobular Carcinoma

Otto Metzger, MD
Boston
March 29, 2022

Thesis

- ILC represents a unique breast cancer subtype deserving special attention
 - clinical presentation
 - responsiveness to therapies
 - pattern of disease dissemination
 - unique genomic features

Challenge: Limited clinical data and inherent challenges to the interpretation of subgroup analyses

A RARE FORM OF MAMMARY CANCER

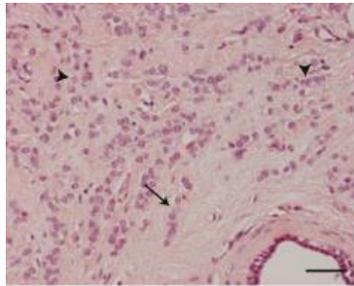

FRANK W. FOOTE, JR., M.D., and FRED W. STEWART, M.D.

(From the Pathological Laboratories of the Memorial Hospital, New York, N.Y.)

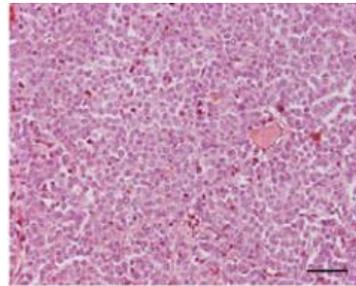

“ It is apparent, however, that this type of mammary cancer, i.e., cancer originating in lobules and terminal ducts, is more common than this incidence would appear to indicate, for, when the tumor infiltrates, it is apt to do so in a peculiar fashion which permits one, after some experience, to recognize the high probability of such origin even though it is impossible actually to trace it ”

Background

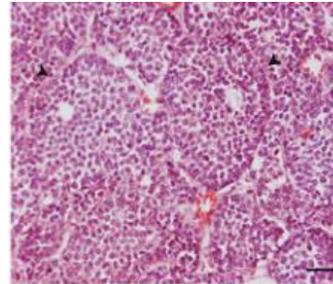

- Classic ILC is the most common subtype
- Other variants: solid, tubulo-lobular, alveolar and pleomorphic

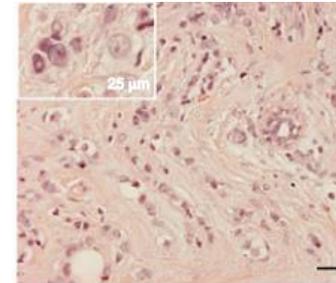

Classic ILC

Solid ILC

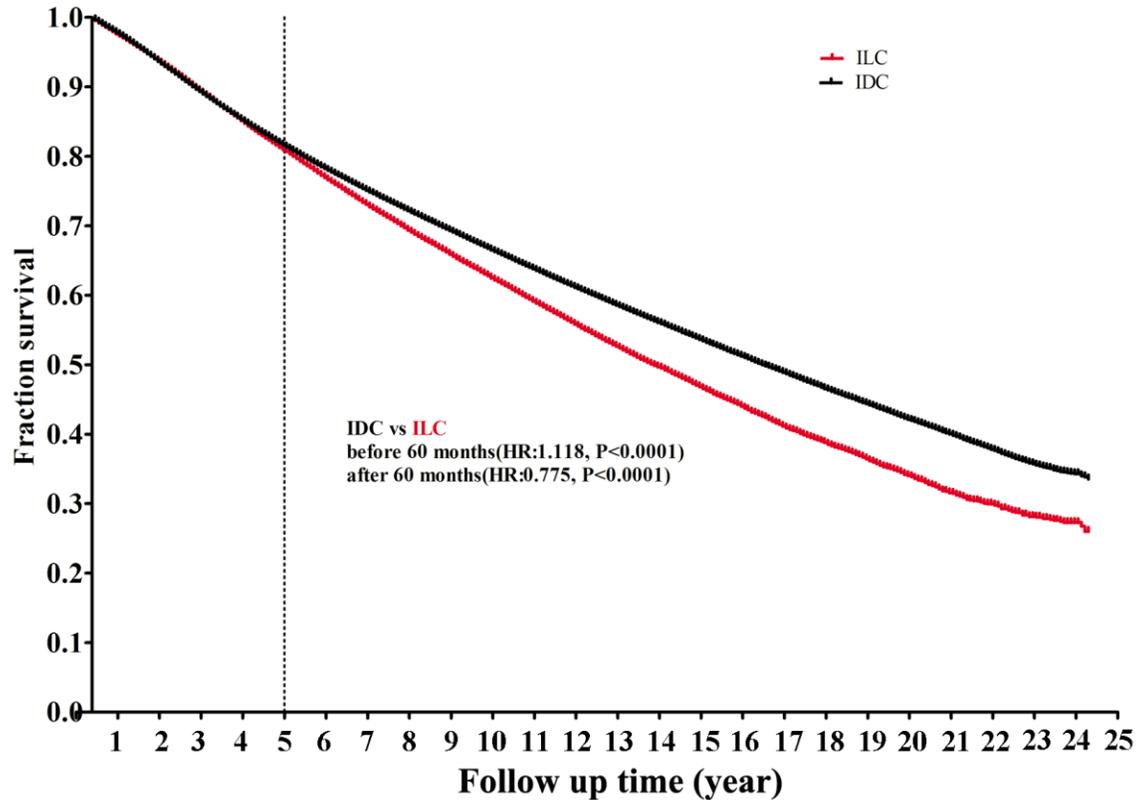

Alveolar ILC

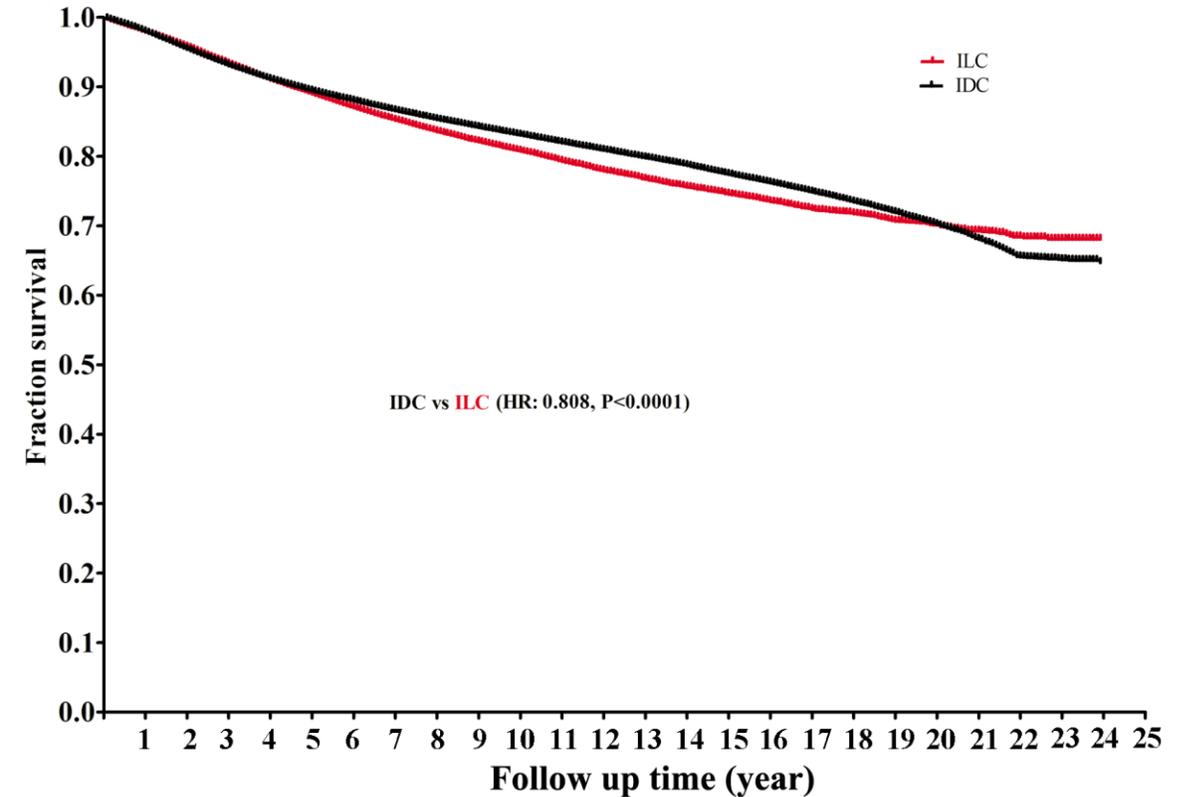

Pleomorphic ILC

Comparison of overall survival and disease-specific survival rates of IDC and ILC

Overall survival

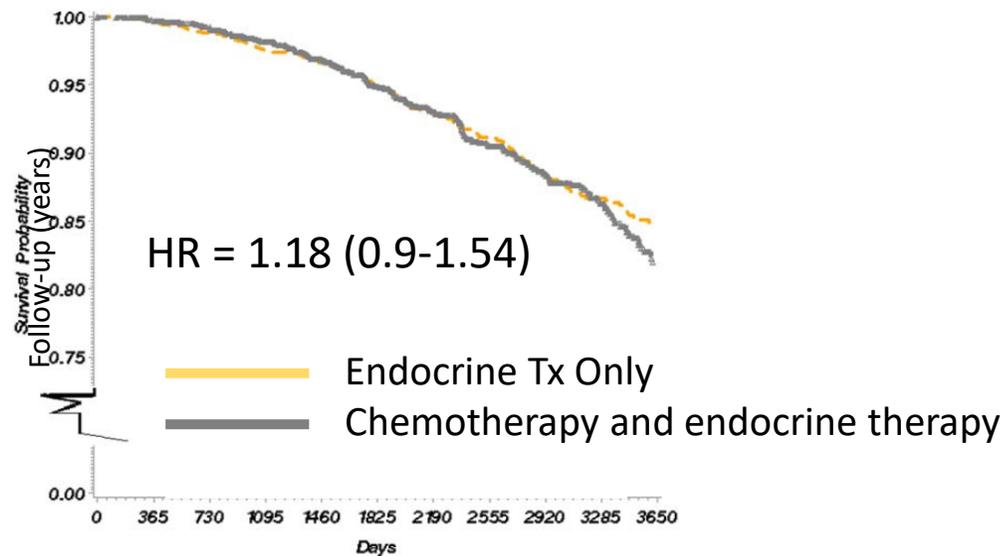

Disease-specific survival

Adjuvant Chemotherapy

Is the lack of Treatment Effect Consistent Across Subgroups?

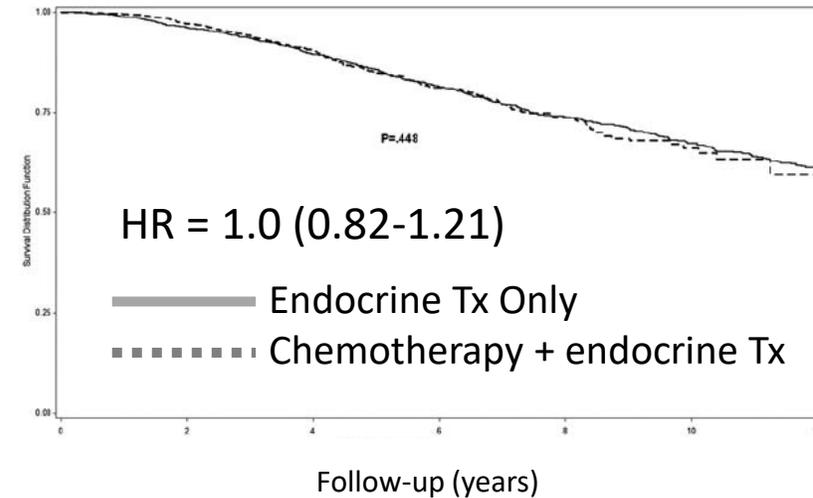

California Cancer Registry

N= 4095 ILC

- 11% Histologic Grade 3
- HG3 vs HG1: HR = 1.49 (1.01-2.19) p = 0.04

Netherlands Cancer Registry

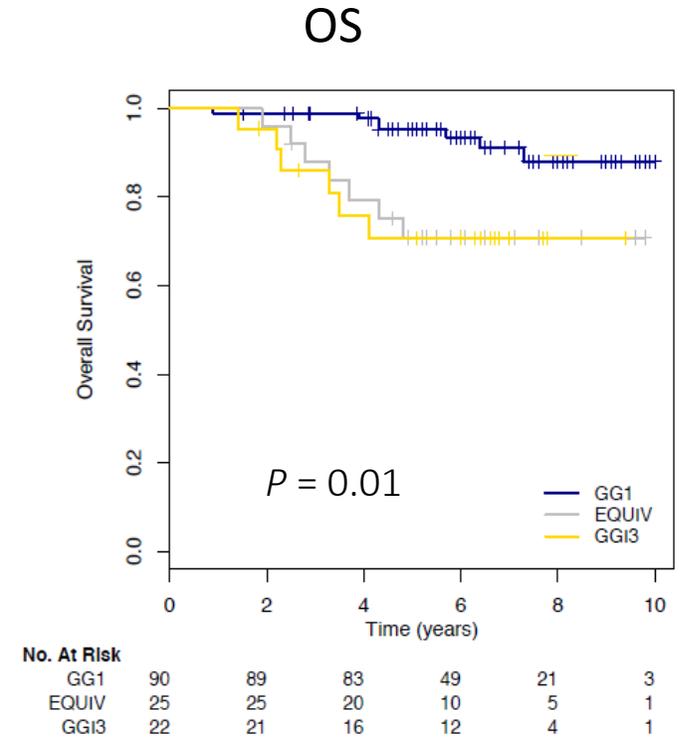

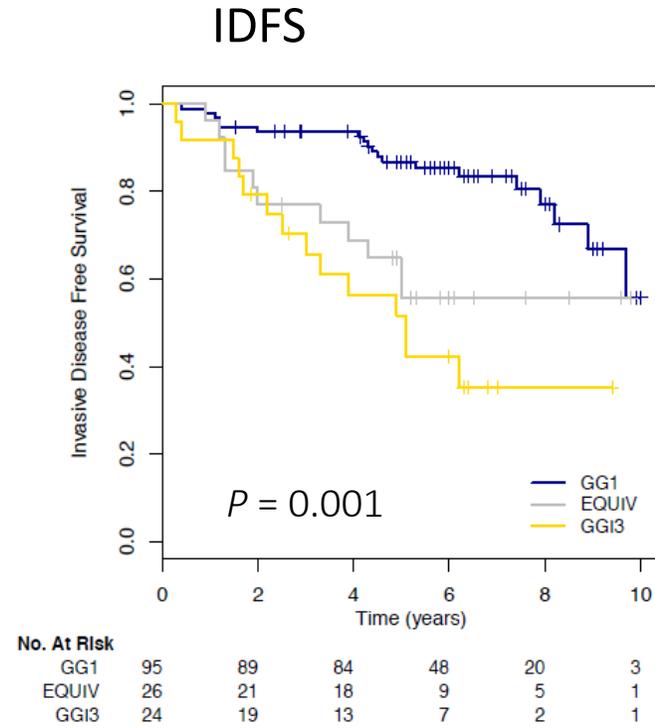

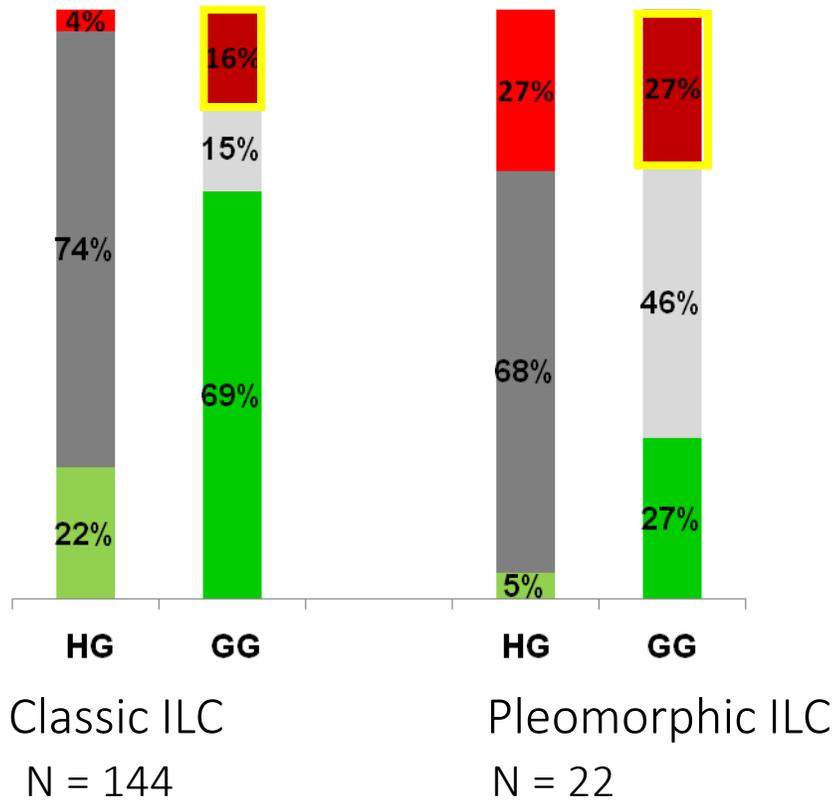

N= 3685 ILC

- 11% Histologic Grade 3
- HG3 vs HG1: HR = 1.54 (1.07-2.22) p = 0.021

Are we missing a small subgroup of ILC that could potentially benefit from adjuvant chemotherapy?

Genomic Grade Index

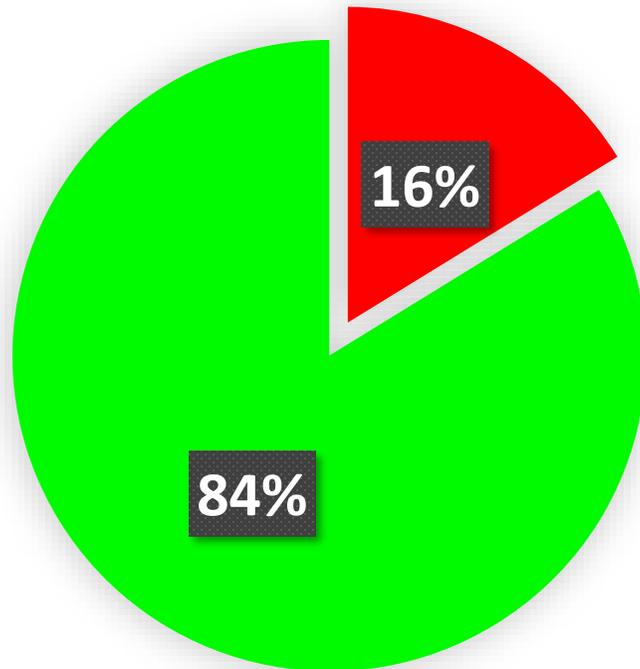

- HG3
- HG2
- HG1
- GG3
- Equivocal
- GG1

Clinical Utility of MammaPrint testing in Invasive Lobular Carcinoma: Results from the MINDACT phase III trial

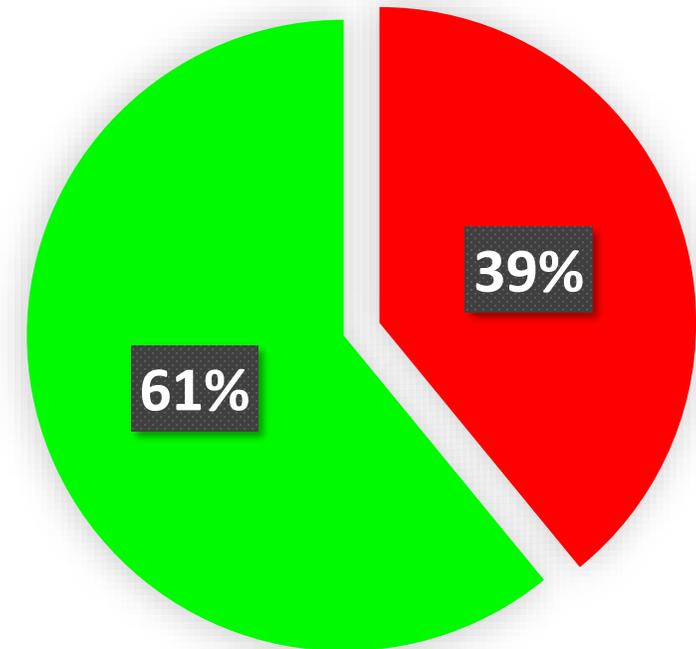

Otto Metzger, Fatima Cardoso, Coralie Poncet, Christine Desmedt,

Adjuvant Endocrine Therapy

Endocrine Therapy Recommendations for ILC

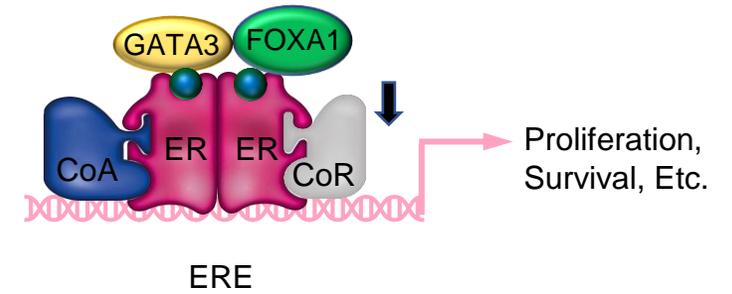

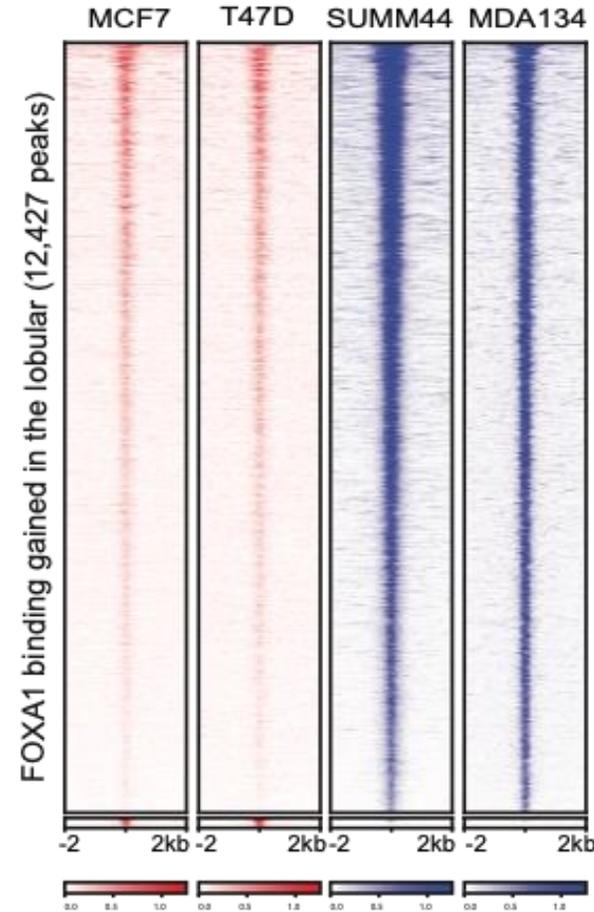

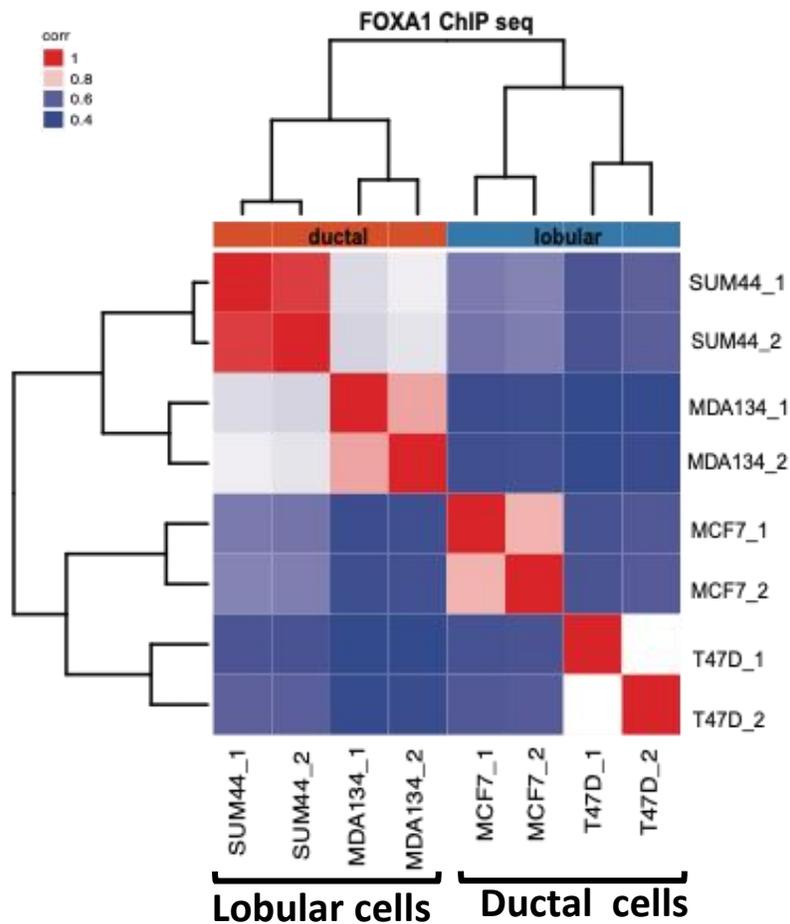

- BIG 1-98 Analytic Cohort
- 12-year updated

Disease-free survival

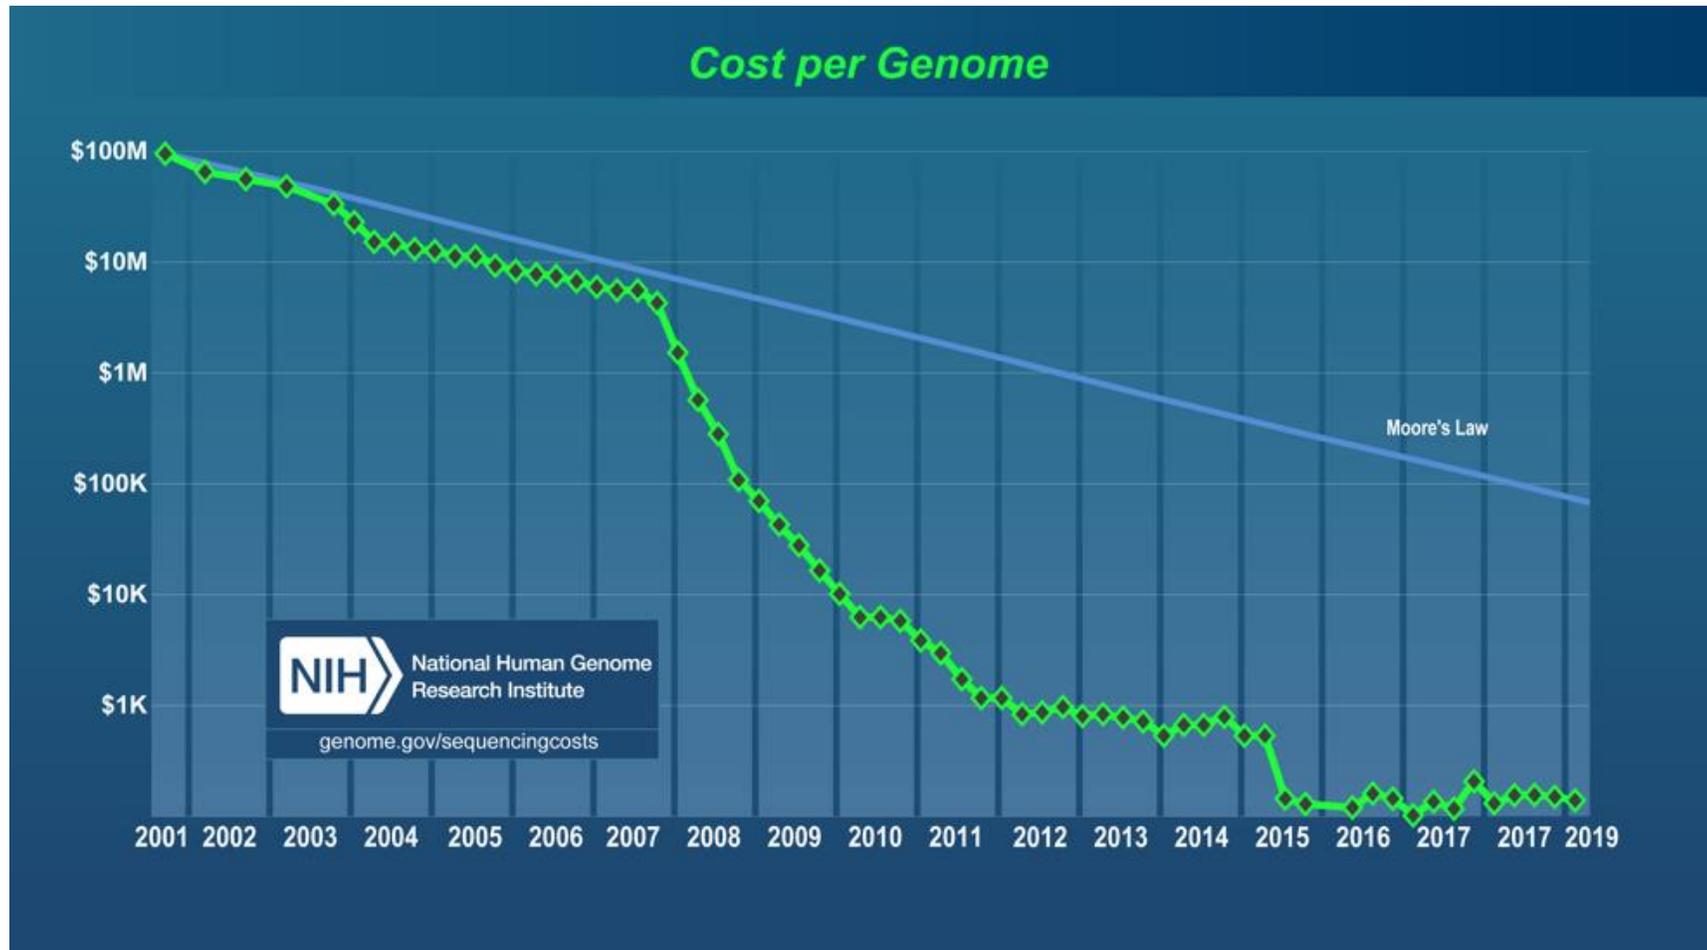

ILC has a Unique Chromatin State Shaped by FOXA1 Gained Binding that Dictates a Unique ER Axis and Resistance to Tamoxifen

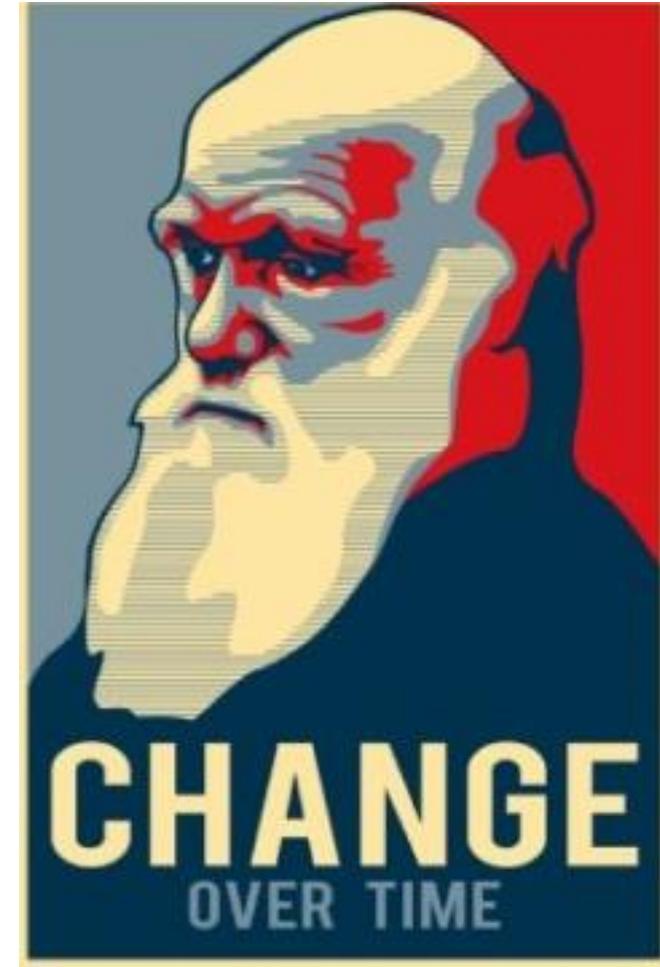

Translating all knowledge towards tailored
treatment for patients diagnosed with
advanced breast cancer

Genomics: Falling Cost is Driving Change

Genomics-Based Approaches

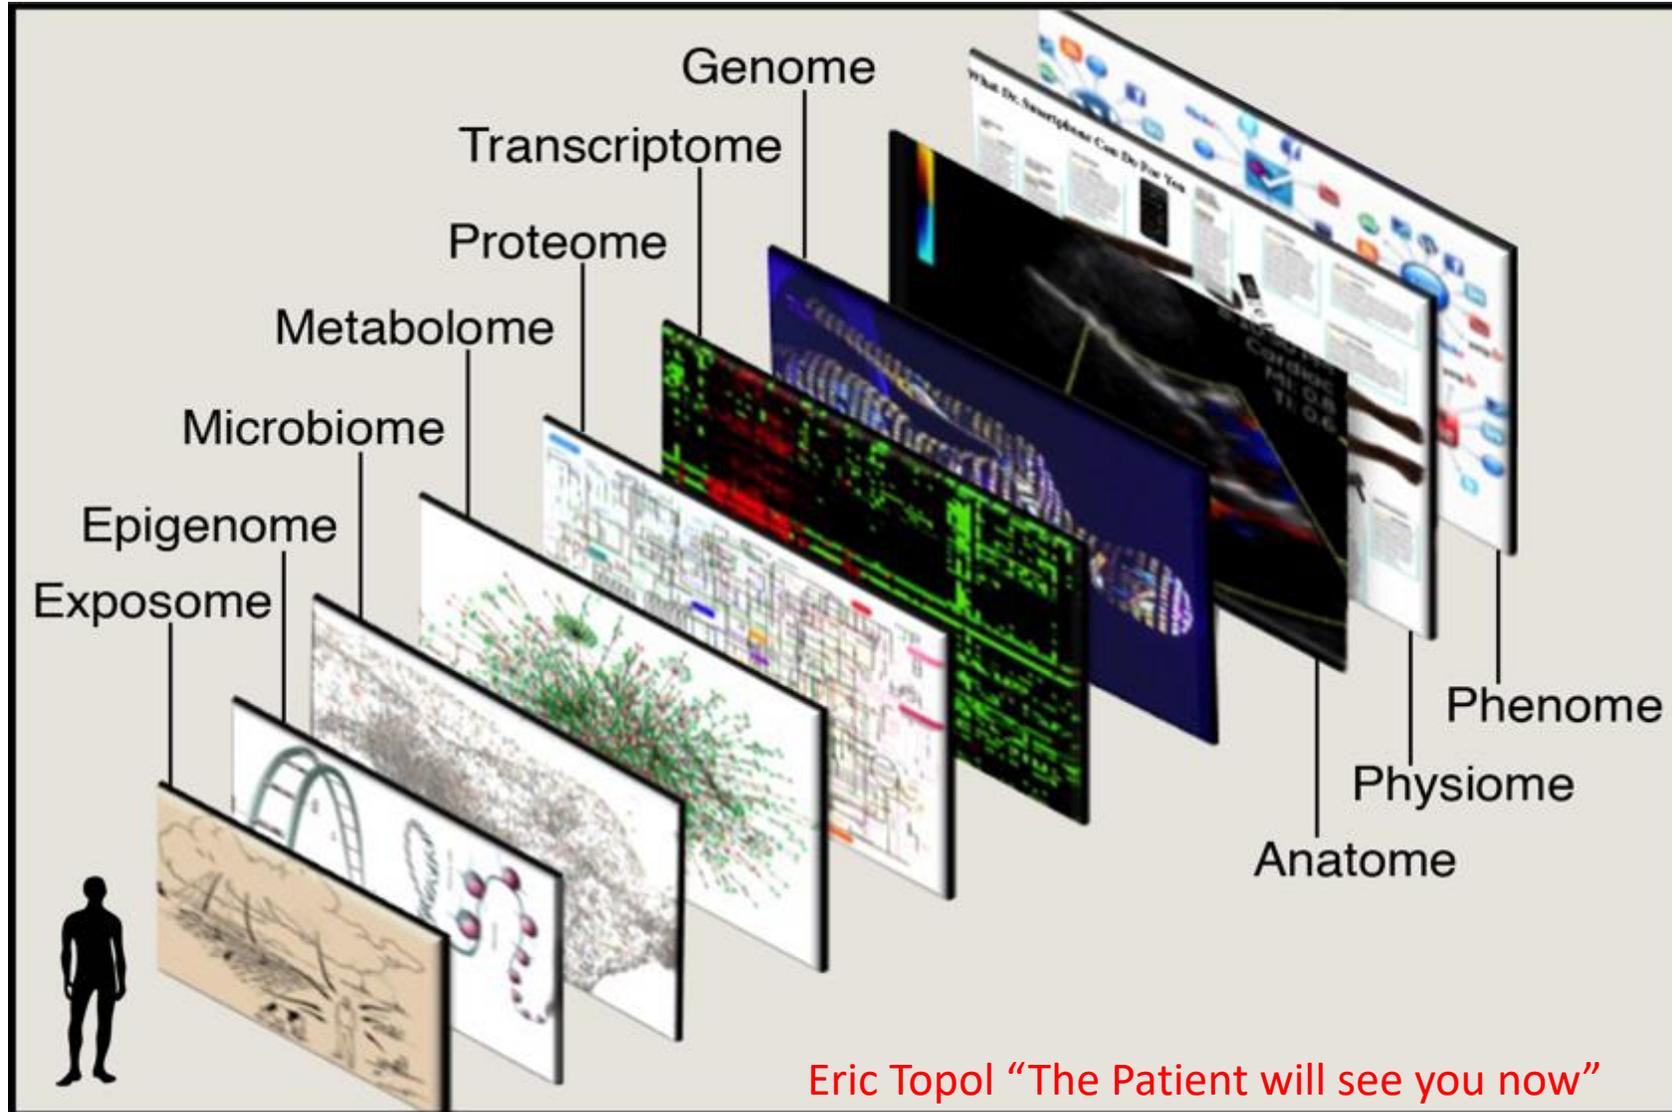

- Diagnostic (adjunct to imaging)
- Adjuvant/Neoadjuvant (early micrometastatic)
- Surveillance (later micrometastatic)
- Metastatic (overt)

Adapted from Prof. Sledge

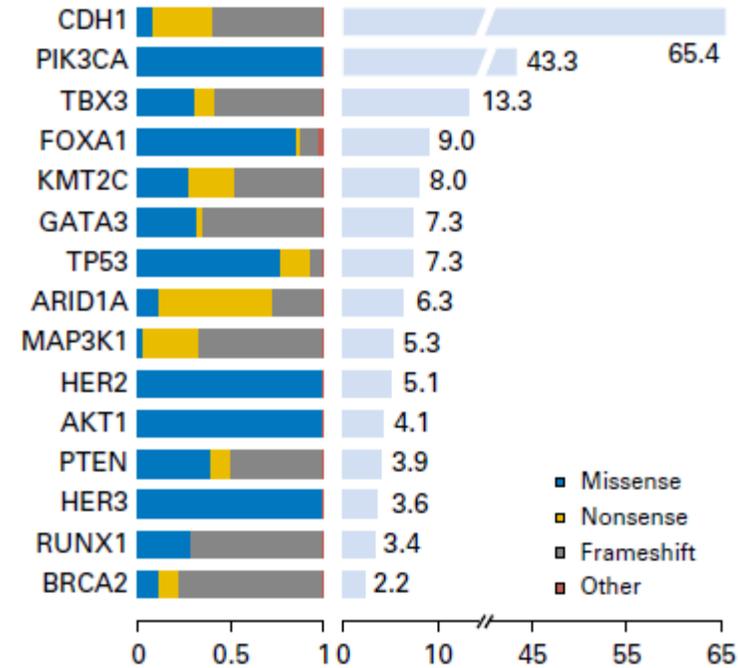

Human "GIS"

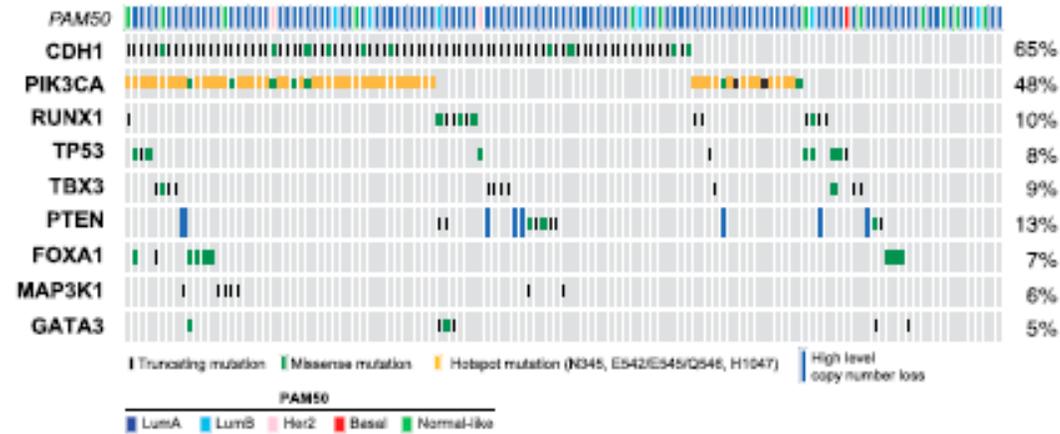

Genomic Landscape of ILC tumors

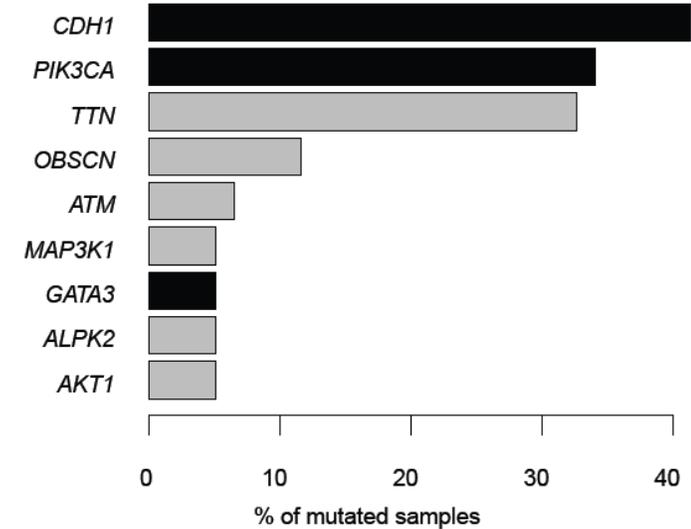

Desmedt et al. n=414

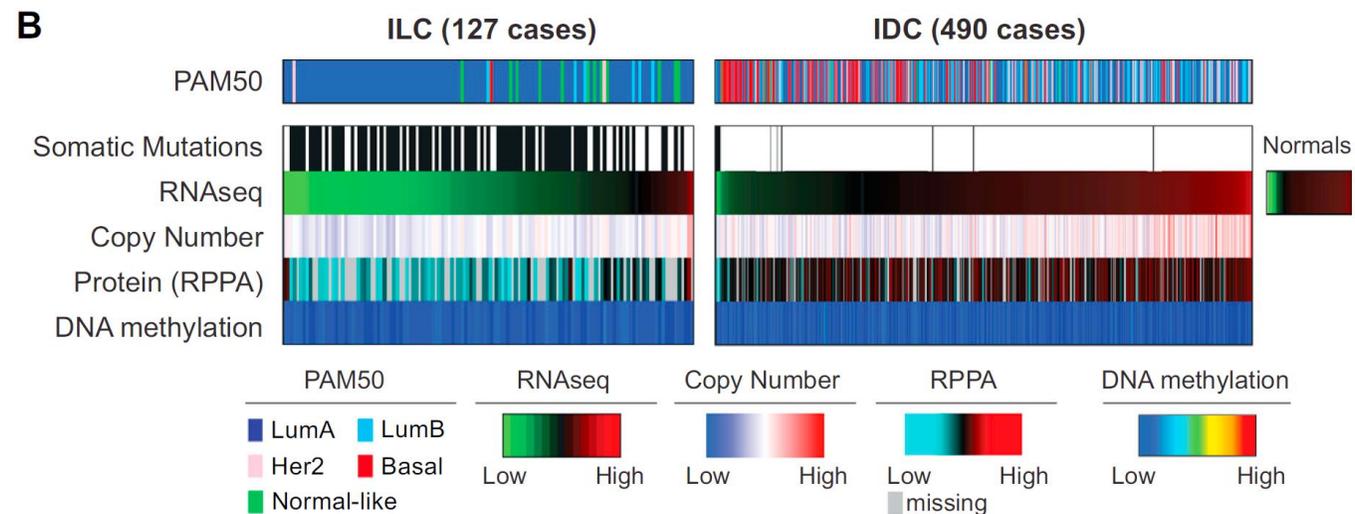

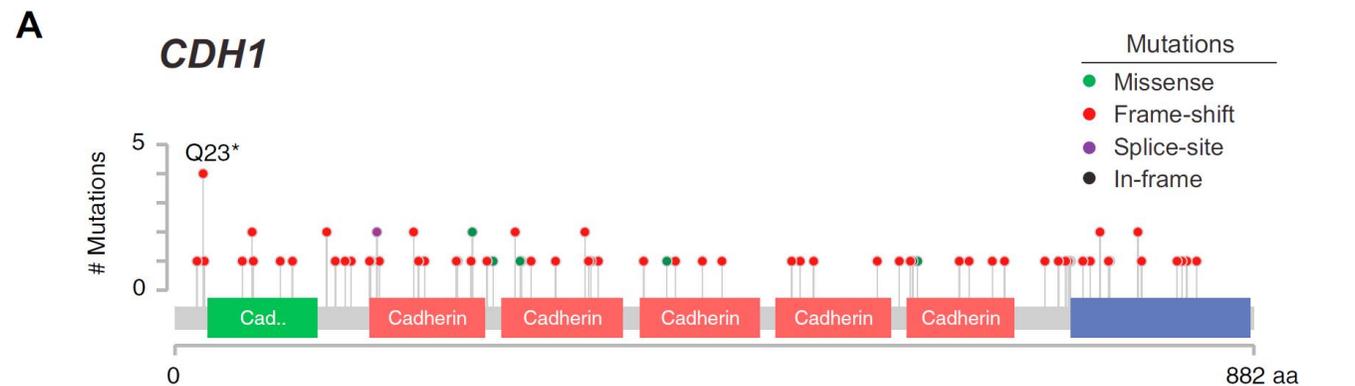

Ciriello et al. n=127

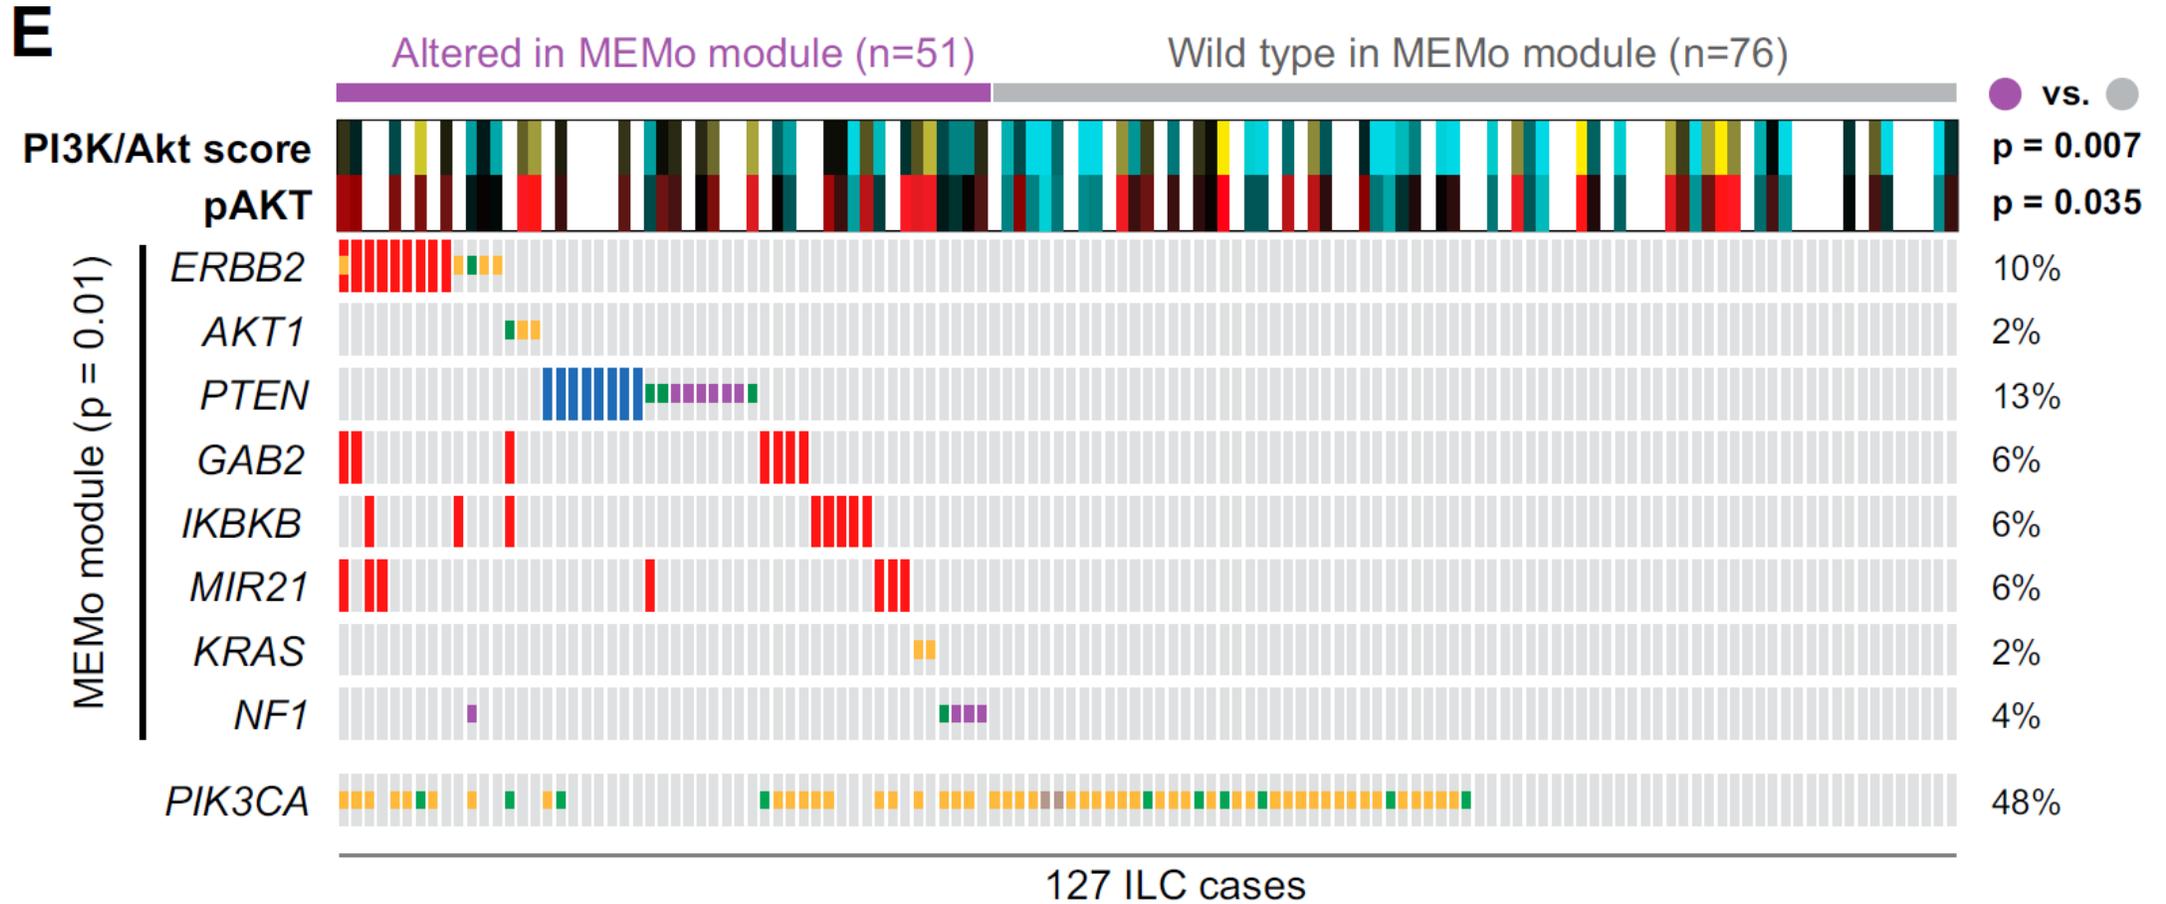

Michaut et al. n=138

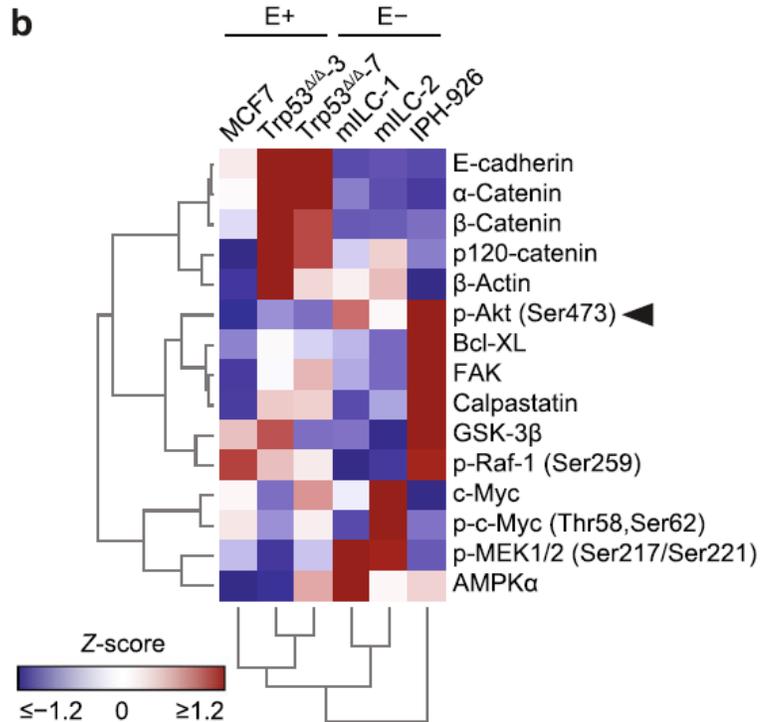

CDH1 (E-cadherin) alterations

40% of ILC have an alteration converging to AKT activation

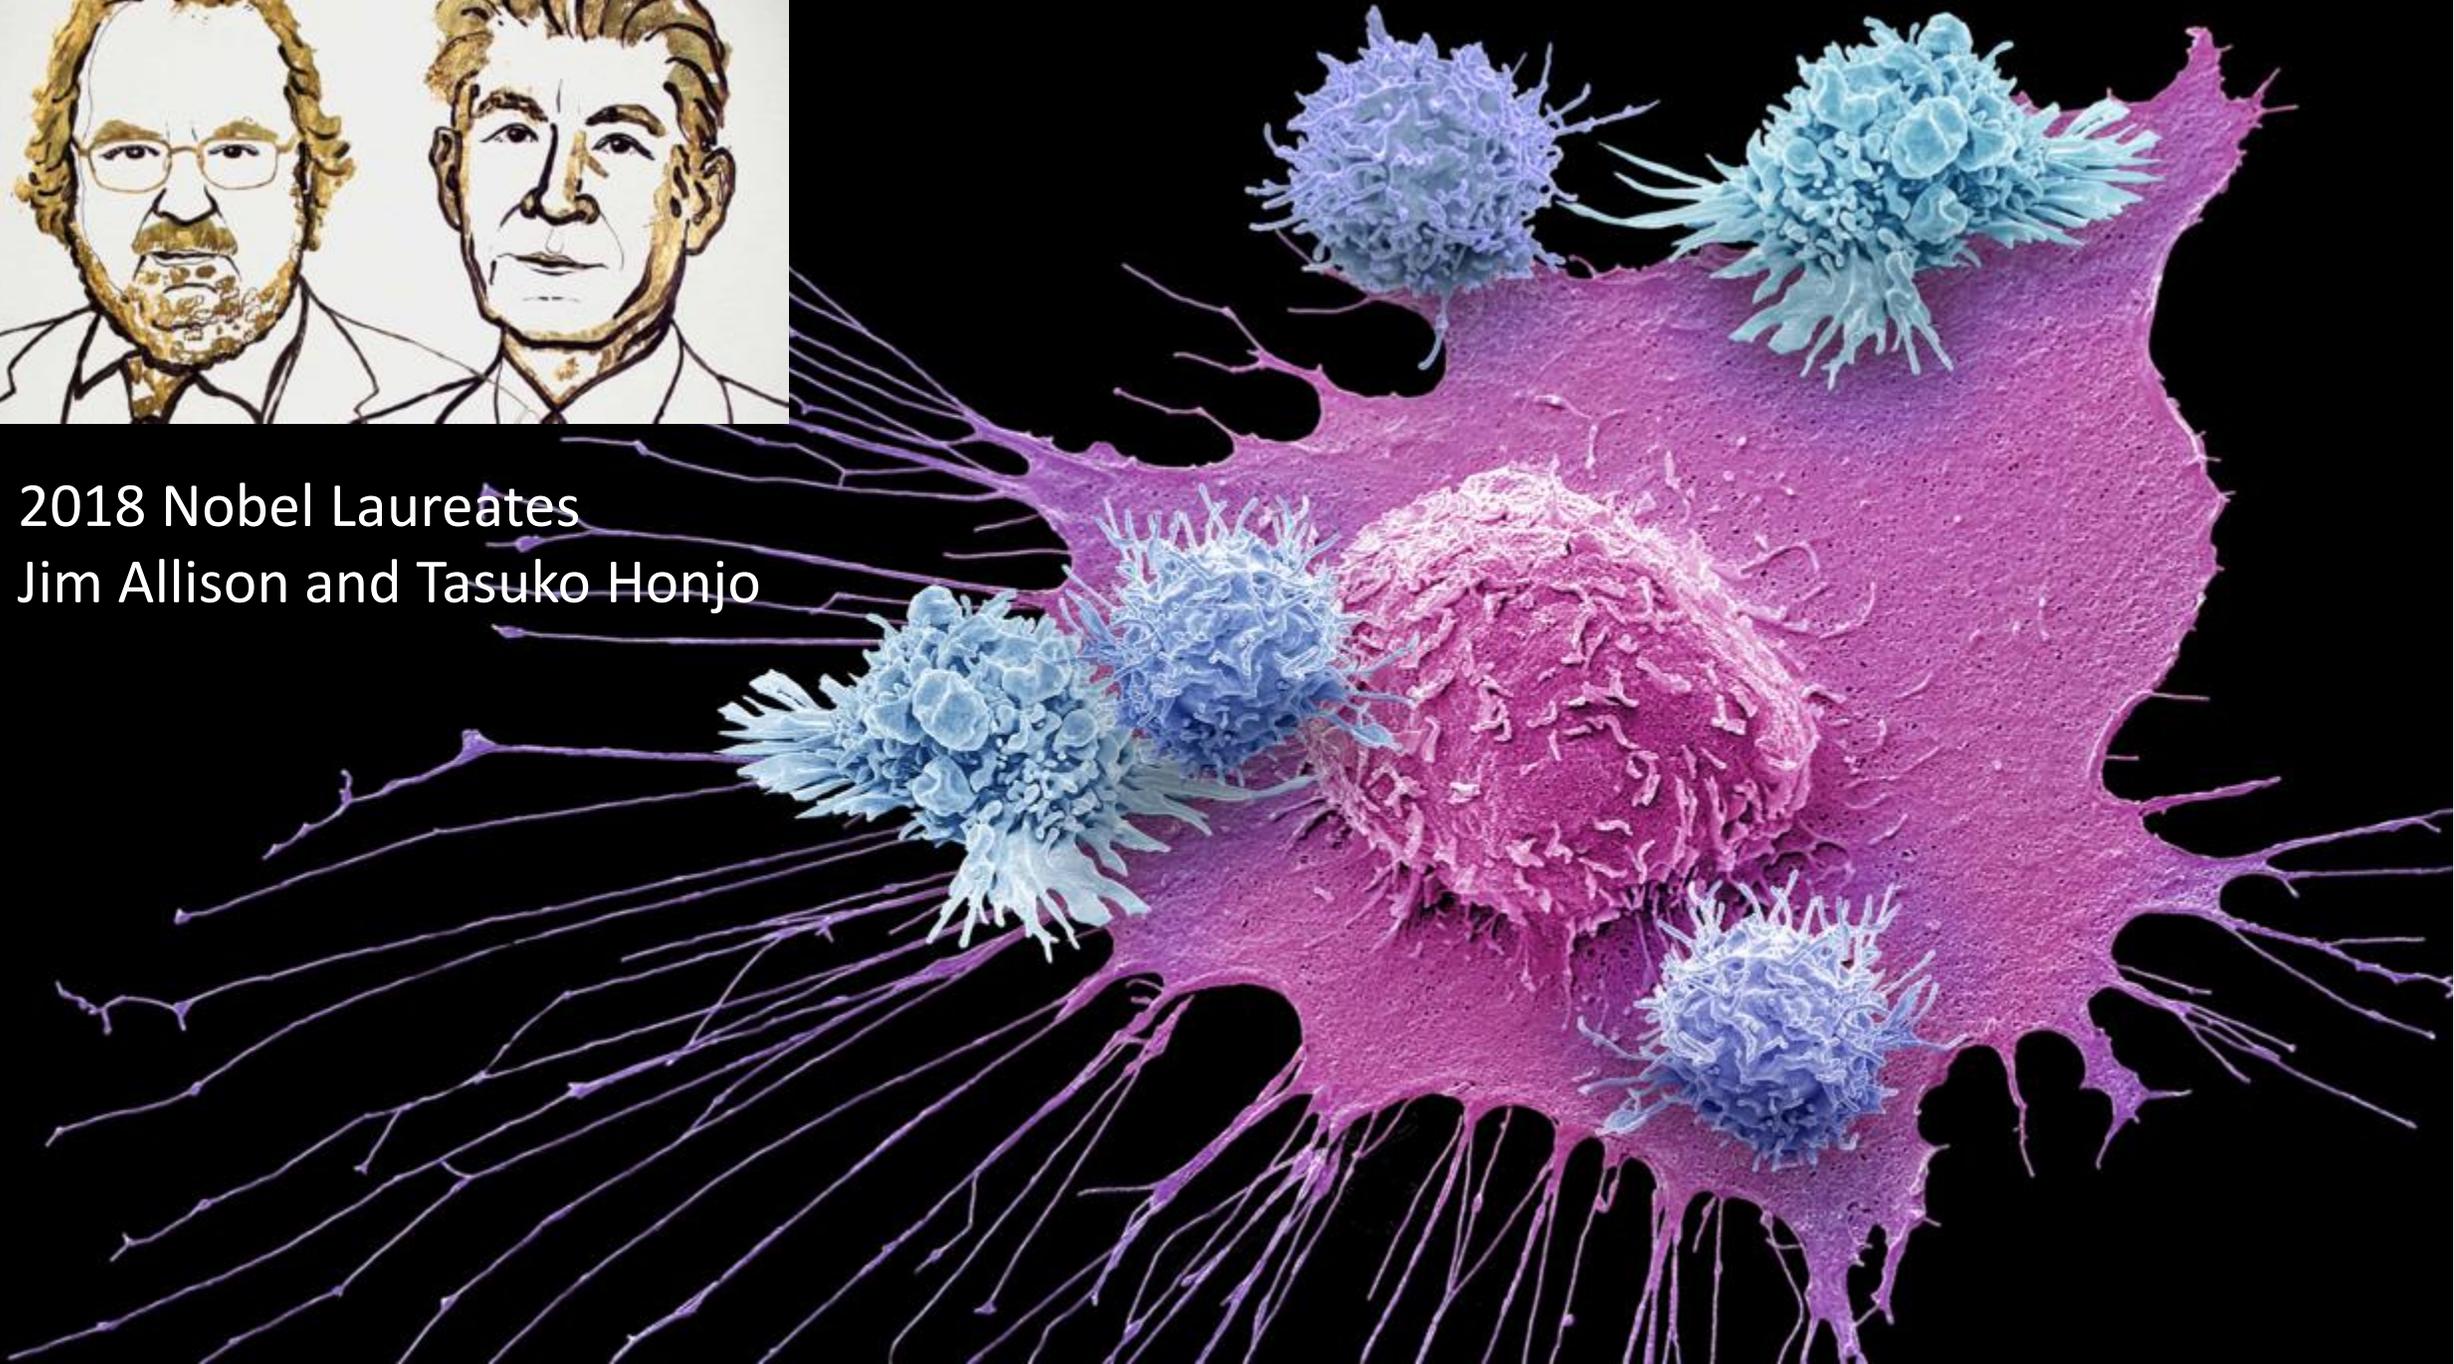

PI3K/AKT activation is independent of *PIK3CA*, *AKT1* or *PTEN* mutations

- Growth factor signals are hyperactivated upon E-cadherin loss, independent of somatic activating mutations in downstream effectors
- **Potential for drugs targeting the PI3K/Akt axis in ILC, irrespective of oncogenic pathway mutations**

2018 Nobel Laureates

Hypermutated breast cancers according to pathological characteristics

Characteristics	# of Patients	N = 78 (Hypermutated)	% of hypermutated tumors	Median TMB
Tumor histology				
- IDC	2513	39	1.6	14.96
- ILC	448	24	5.4	15.25
- Others	493	2	0.4	20.9
- Mixed	183	7	3.8	14.12
- Unknown	367	6	1.6	13.9
Sample type				
- Metastatic	1709	52	3.1	14.69
- Primary	2188	26	1.2	15.61
Tumor Subtype				
- HR+/HER2-	741	19	2.6	17.59
- HER2+	184	5	2.7	15.41
- TNBC	193	8	4.2	16.07
- Unknown	2886	46	1.6	14.12

HER2 mutations

HER2 mutations across 1,500 breast cancer patients

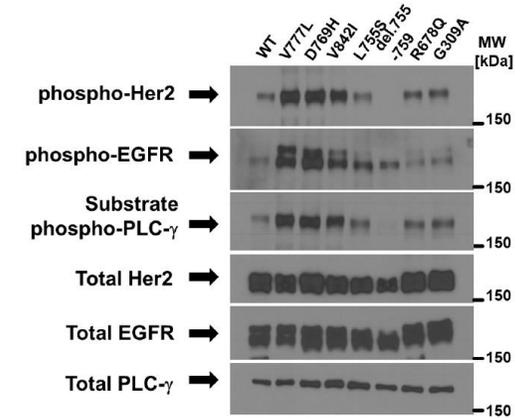

Mutation frequency:

- Newly diagnosed patients = 1.6% → 4,000 pts annually.
- Metastatic breast cancer = 2-2.5% → 4,000 – 5,000 MBC cases
- Invasive lobular breast cancer = 5-7%

Incidence/prevalence

Imaging
What is new?

ER-targeted PET/CT

**18F-Fluoroestradiol
(FES)**

	Disorder	Number of patients	Study aim	Conclusions	
	Zhao et al, 2013 ⁴⁷	Uterine tumours	47	Assess relation between tumour ¹⁸ F-FDG and ¹⁸ F-FES uptake with ER, GLUT-1, and Ki-67	¹⁸ F-FES uptake correlated with ERα and PR expression, and ¹⁸ F-FDG uptake with GLUT-1 and Ki-67
	Van Kruchten et al, 2012 ⁴⁸	Breast cancer	33	Assess clinical value of ¹⁸ F-FES-PET in patients with unresolved diagnosis after conventional workup	¹⁸ F-FES-PET aided diagnosis and therapy decision making
	Peterson et al, 2011 ⁴⁹	Breast cancer	239	Assess correlations between ¹⁸ F-FES uptake and clinical and laboratory data, effects of previous treatments and ¹⁸ F-FES metabolism	¹⁸ F-FES uptake correlated positively with BMI and inversely with plasma SHBG levels and binding capacity
	Yoshida et al, 2011 ⁴⁸	Suspected uterine sarcoma	24	Assess usefulness of ¹⁸ F-FES-PET and ¹⁸ F-FDG-PET to differentiate uterine sarcoma from leiomyoma	¹⁸ F-FDG to ¹⁸ F-FES ratios >2.0 differentiated with 90.9% sensitivity and 92.3% specificity
	Kurland et al, 2011 ⁴⁸	Metastatic breast cancer	91	Measure variability in ¹⁸ F-FES uptake between and within patients	Substantial variation seen between patients (37% had low or absent uptake; roughly 40% had mixed uptake)
	Linden et al, 2011 ⁴⁷	Metastatic breast cancer	30	Measure changes in ¹⁸ F-FES uptake during treatment with aromatase inhibitors, tamoxifen, or fulvestrant	No effect with aromatase inhibitors, decreases of around 55% with tamoxifen and fulvestrant
	Tsujikawa et al, 2009 ⁴⁴	Endometrial cancer	19	Assess correlation between ¹⁸ F-FES-PET, ¹⁸ F-FDG-PET, and ER-status on immunohistochemistry	Correlations for tumour ERα status good
	Tsujikawa et al, 2009 ⁴⁴	Endometrial cancer	31	Assess correlation between ¹⁸ F-FES-PET, ¹⁸ F-FDG-PET, and clinicopathological features	¹⁸ F-FES to ¹⁸ F-FDG ratios correlated with tumour aggressiveness
	Yoshida et al, 2009 ⁴⁸	Ovarian cancer	3	Review role of PET in ovarian cancer (plus preliminary results of ¹⁸ F-FES-PET in three patients)	¹⁸ F-FES uptake was seen in ER-positive tumours
	Dehdashti et al, 2009 ⁴⁸	Metastatic breast cancer	59	Investigate whether ¹⁸ F-FES-PET and serial ¹⁸ F-FDG-PET (plus oestradiol challenge) predicts response to endocrine therapy	Baseline tumour ¹⁸ F-FES uptake and metabolic flare after oestradiol challenge both predictive of treatment response
	Peterson et al, 2008 ⁴⁷	Primary and metastatic breast cancer	17	Assess correlation between ¹⁸ F-FES uptake and immunohistochemistry	Good correlation for ERα
	Tsujikawa et al, 2008 ⁴⁸	Endometrial hyperplasia	2	Assess effect of tamoxifen on ¹⁸ F-FES uptake	Take endocrine therapy into account when using ¹⁸ F-FES-PET to assess ER status
	Tsujikawa et al, 2008 ⁴⁸	Benign and malignant uterine tumours	38	Assess relation between ¹⁸ F-FES and ¹⁸ F-FDG uptake in benign and malignant uterine tumours	¹⁸ F-FES to ¹⁸ F-FDG ratios aided differentiation of diagnosis of uterine tumours
	Tsuhida et al, 2007 ⁴⁸	Healthy volunteers	16	Assess relation between ¹⁸ F-FES uptake, menstrual cycle, and endogenous oestrogen concentrations	Changes in ¹⁸ F-FES uptake were consistent with changes in ER concentrations on immunohistochemistry
	Yoshida et al, 2007 ⁴⁸	Endometrial cancer	1	Use ¹⁸ F-FES-PET to assess response to medroxyprogesterone in endometrial cancer	Focal uptake, confirmed by histology
	Kanne et al, 2007 ⁴⁷	Metastatic breast cancer	1	Investigate use of ¹⁸ F-FES-PET and ¹⁸ F-FDG-PET in a patient with gastric linitis plastica from metastasis of ER-positive lobular breast cancer	¹⁸ F-FES-PET confirmed regional ER binding in metastases
	Linden et al, 2006 ⁴⁷	Metastatic breast cancer	47	Quantify tumour ¹⁸ F-FES uptake as predictor of response to endocrine therapy	Absence of uptake predicts failure of endocrine therapy
	Mortimer et al, 2001 ⁴⁴	Breast cancer	40	Assess serial ¹⁸ F-FES-PET and ¹⁸ F-FDG-PET to predict response to tamoxifen	Increase in ¹⁸ F-FDG uptake and decrease in ¹⁸ F-FES uptake after the start of tamoxifen predicted response
	Mankoff et al, 2001 ⁴⁵	Breast cancer	49	Radiation dosimetry of ¹⁸ F-FES-PET	Radiation dose is similar to commonly used nuclear medicine tests
	Towson et al, 1999 ⁴³	Breast cancer	18	Assess interaction between SHBG and ¹⁸ F-FES	Around 45% of ¹⁸ F-FES was bound to SHBG and could affect tracer uptake
	Dehdashti et al, 1999 ⁴⁷	Metastatic breast cancer	11	Assess serial ¹⁸ F-FES-PET and ¹⁸ F-FDG-PET to predict response to tamoxifen	Increase in ¹⁸ F-FDG uptake and decrease in ¹⁸ F-FES uptake after the start of tamoxifen predicted response
	Moresco et al, 1997 ⁴⁸	Meningioma	6	Assess ER-status of meningiomas by means of ¹⁸ F-FES-PET	Four of six patients showed focal ¹⁸ F-FES uptake, and uptake correlated with immunohistochemistry status in five of six patients
	Mankoff et al, 1997 ⁴⁶	Primary or metastatic breast cancer	15	Assess clearance of labelled ¹⁸ F-FES metabolites	Rapid clearance
	Mortimer et al, 1996 ⁴⁸	Primary or metastatic breast cancer	43	Assess correlation between ¹⁸ F-FES-PET and ¹⁸ F-FDG and in-vitro assays for response to therapy	¹⁸ F-FES-PET had a sensitivity of 76% and specificity of 100% compared with immunohistochemistry
	Dehdashti et al, 1995 ⁴⁷	Primary or metastatic breast cancer	53	Compare ¹⁸ F-FES-PET with ¹⁸ F-FDG-PET and immunohistochemistry	¹⁸ F-FES-PET 88% agreement with immunohistochemistry and provided information not obtained by ¹⁸ F-FDG-PET
	McGuire et al, 1991 ⁴⁷	Metastatic breast cancer	16	Assess use of ¹⁸ F-FES-PET in ER-positive metastatic postmenopausal breast cancer	¹⁸ F-FES-PET sensitivity 93%
	Mintun et al, 1989 ¹	Primary breast cancer	13	Assess feasibility of ¹⁸ F-FES-PET to detect primary ER-positive breast-tumour lesions and correlation with in-vitro ER status	Focal uptake seen in all patients with ¹⁸ F-FES and uptake correlated well with in-vitro assays (r=0.96)

FES PET/CT

- FES SUV correlates with ER on IHC
- FES predicts response to endocrine therapy

Van Kruchten et al,
Lancet Oncology
2013

Complete suppression of FES avidity

Clinical Trials

What are clinical trial phases?

Clinical trials are conducted in a series of steps (phases) - each phase is designed to answer a separate research question.

- **Phase I:** Testing a new treatment in a small group to evaluate safety, dose, and side effects.
- **Phase II:** Evaluating within a larger group the efficacy and safety of a new treatment
- **Phase III:** A comparison study in a large group to determine if a new treatment works better than standard therapy. These trials typically involve randomization and may have a placebo; the data from a phase 3 trial can be used for FDA drug approval.

Phase I	Phase II	Phase III	Phase IV
20-80 participants	100-300 participants	1,000-3,000 participants	Thousands of participants
Up to several months	Up to (2) years	One (1) - Four (4) years	One (1) year +
Studies the safety of medication/treatment	Studies the efficacy	Studies the safety, efficacy and dosing	Studies the long-term effectiveness; cost effectiveness
70% success rate	33% success rate	25-30% success rate	70-90% success rate

FDA approval

Clinical Trials: FAQs

What are the unique aspects related to ILC?

- We are moving away from the requirement of measurable disease to define eligibility criteria

What do expect for novel drugs being developed based on ER status rather than histological subtypes?

- Unless proven otherwise novel hormonal therapies and targeted agents are likely to work equally well for patients diagnosed with ILC or not

Do we need clinical trials specifically for ILC?

- ✓ scientific background must be robust
- ✓ advocate for cohorts representing ILC on specific studies
- ✓ capture information regarding histological subtypes and encourage central path review

Conclusions (and personal bias)

ILC accounts for a unique breast cancer subtype

- We are making real progress!
 - patients are living longer and better
 - promising drugs being developed
 - better longitudinal characterization of the disease to inform tx decisions
 - for patients being tx for advanced disease the clinical evaluation is key, so no reason to be overly concerned about the limitations of current imaging

We will continue to work non-stop to improve outcomes to patients diagnosed with ILC
